

WEEK01- Weekly Submission.

- **What shared Responsibility Mapping is**

It is a framework that divides cloud security and compliance duties between Amazon Web Services and the customer.

- **The 3 Scenerio's Answer.**

Scenario 1- Policy Validation and Permissions was skipped, and that led to an unauthorised access. AWS is not the cause, the customer is.

Scenario 2- EC2 and CVE. The User failed to conduct an Update on the OS patch. The Customer is responsible for the problem.

Scenario 3- Hardware Failure. AWS has responsibility over all physical systems, The damage is caused by AWS .

- **Why this model matters :** the shared responsibility model ,matters because it ensures cloud security compliance and prevents data breaches by defining clear boundaries between AWS and the business.
